## Davis Crane

### Bridge Demolition

This two-night project in Dallas, Texas required the power and reach of the LTM 1650-8.1 to remove bridge beams in carefully planned stages—eastbound lanes the first night, followed by westbound lanes the next. Phasing the work in this manner helped minimize disruptions while maintaining strict safety and scheduling requirements.

Overnight operations add an additional layer of complexity, from limited visibility to tight time windows, making clear communication and precise execution essential. Through disciplined coordination and a steady, methodical approach, the team completed each lift efficiently and safely, demonstrating the same level of focus and professionalism they bring to every project.
