DAVIS CRANE SERVICE

Dam Structure Component Placement

This project at a North Texas dam site involved placing structural components critical to ongoing construction using our Liebherr LTM 1750, configured with a luffing jib and substantial counterweight. Due to underground utilities and contractor crane capacity requirements, the lift required detailed planning before work began. From mobilization to final placement, close coordination between crews ensured each piece was handled safely and positioned as intended, demonstrating the preparation and teamwork these large-scale infrastructure projects demand.
