DAVIS CRANE SERVICE

Structural Beam Placement

This project involved placing multiple structural beams for an ongoing infrastructure build using our Liebherr LTM 1400. Working within a tight footprint and near de-energized, grounded power lines, the lift required detailed planning and close coordination between the operator, rigging crew, and on-site personnel. Each beam was precisely positioned at a 105-foot radius, resulting in a safe and efficient installation that reflects the preparation and teamwork these projects demand.
